Fraud Prevention System for a safer, stronger SushiKi.

A premium, client-ready roadmap that turns fraud control into a clear business advantage for Mr. Sadik and the SushiKi team.

PROTECT REVENUE | CONTROL STAFF RISK | VERIFY DELIVERIES | TRACK EVERY ACTION

3
FRAUD RISK ZONES
Customer, staff, and rider controls must work together.

1
WEEK TO START
Phase 1 brings the fastest protection and clearest ROI.

70%
LOSS REDUCTION GOAL
Expected reduction once core verification and audit controls are live.

Top-level message

1. **Stop fraud before it happens**
   Use OTP, delivery PIN, GPS checks, and order rate limits.
2. **Limit risky actions inside operations**
   Require manager PIN and role-based permissions for sensitive actions.
3. **Create full visibility and proof**
   Audit logs, shift tracking, and proof of delivery make disputes easier to resolve.

LAYER 01
Verify
OTP, PIN, GPS, and rate limiting stop fake actions early.

OUTCOME
Grow Safely
Lower losses, fewer disputes, and stronger client confidence.

SushiKi Shield

LAYER 02
Control
Manager approval and role restrictions block internal abuse.

LAYER 03
Track
Audit logs and cash reconciliation create accountability.

RISK MAP

Where SushiKi loses money today

The biggest vulnerability is not customers. It is internal staff abuse, followed by rider-side delivery manipulation.

MEDIUM RISK

Customer fraud

- Fake orders and bot activity
- Cash refusal at delivery
- Chargebacks and disputes
- Repeat scammer behavior

Current OTP helps, but the business still needs rate limits, fraud flags, and first-order address validation.

HIGHEST RISK

POS staff abuse

- Deleting items after kitchen print
- Unauthorized discounts and voids
- Cash drawer theft and ghost orders
- No clear shift accountability

This is the main revenue leak. Staff actions need manager approval, immutable logs, and shift-by-shift cash control.

HIGH RISK

Rider manipulation

- Fake delivered status
- GPS spoofing or non-arrival
- Cash handling problems
- False customer-not-home claims

Delivery needs proof. PIN, GPS range checks, and optional photo proof remove ambiguity at the doorstep.

OPERATING FLOW

The protected SushiKi journey

The simplest client view: every order moves through one clean flow, with security checks added at the exact points where fraud usually happens.

01

Customer

OTP verification, order rate limit, fraud flags.

02

Order

State control, address checks, permanent audit trail.

03

Kitchen

Items lock after print. No silent deletion allowed.

04

Rider

Assigned by admin, GPS checked, delivery proof captured.

05

Delivery

Customer PIN confirms handoff and closes disputes.

OTP

Real customer validation

PIN

Proof of receipt

Manager PIN

High-risk action control

GPS

Real location verification

Audit Log

Permanent accountability

3D SECURITY MODEL

Five stacked layers of protection

Instead of one big feature, SushiKi needs a security system where each layer supports the one above it.

Audit Log — Every important action is traceable and reviewable.

Manager Control — Discounts, voids, refunds, and item removal need approval.

Delivery PIN — Customer confirms successful delivery.

GPS Verification — Rider must be near the address before status changes.

OTP + Limits — Only trusted order activity enters the system.

Why this works

Fraud succeeds when there is no proof, no control, and no visibility. This model fixes all three at once.

Best first move

Delivery PIN is the fastest win because it blocks fake delivery claims and gives immediate evidence in disputes.

Operational gain

Staff can still work quickly, but the most sensitive actions become deliberate, approved, and fully traceable.

Client message

SushiKi moves from a basic ordering setup to a controlled, audit-friendly operating platform.

ROADMAP

Three-phase rollout with strongest ROI first

The plan is intentionally phased so SushiKi gets visible protection quickly, then grows into deeper operational control.

PHASE 1 | WEEK 1

Immediate protection

- Delivery PIN on all delivery orders
- Manager PIN for refunds, voids, discounts, item removal
- Immutable audit log collection

Biggest fraud blocker, fastest visible business result, and strongest proof for client confidence.

PHASE 2 | 1 TO 2 WEEKS

Operational control

- Shift tracking and cash reconciliation
- Photo proof of delivery
- Order state machine and customer rate limiting

Fewer disputes, cleaner cash handling, and stronger delivery discipline.

PHASE 3 | LONG TERM

Enterprise hardening

- Role-based permissions across all apps
- 4-eyes approvals for high-value operations
- Anomaly detection and security dashboard

Scalable governance for growth, audits, and multi-location operations.

BEFORE VS AFTER

From reactive operations to controlled operations

This is the business transformation Mr. Sadik should expect after the security roadmap is implemented.

BEFORE

Too much trust. Not enough proof.

- Orders can be manipulated after creation
- Staff discounts and voids are hard to control
- Riders can claim delivery without strong proof
- Cash variance is discovered too late
- Disputes take time and often end in lost revenue

AFTER

Controlled flow with clear accountability.

- Every delivery has customer confirmation
- Critical staff actions require manager approval
- Every change is logged and reviewable
- Cash and shifts are reconciled per user
- Fraud patterns become visible instead of hidden

CLIENT OUTCOME

What SushiKi gains from this plan

The security investment is not only about stopping fraud. It also improves trust, operations, compliance, and long-term scalability.

Revenue protection Fewer chargebacks, fewer fake deliveries, less internal leakage.

DIRECT ROI

Staff accountability Every sensitive action becomes approved, logged, and reviewable.

OPERATIONAL

Stronger delivery proof PIN, GPS, and photo proof reduce doorstep disputes dramatically.

CUSTOMER

Cleaner compliance story Audit trails help with tax review, dispute review, and internal discipline.

GOVERNANCE

"SushiKi becomes a fraud-resistant business platform, not just an ordering system."

Recommended starting point: launch Phase 1 first with delivery PIN, manager PIN, and audit log. That gives the fastest protection with the clearest visible result for the client.
