BLACK LAYERS STRATEGY DECK

Black Layers AI Marketing Agent

A structured plan to run Black Layers marketing, research, lead generation, content creation, and reporting through one cloud-based AI operating system.

OPENCLAW | GOOGLE CLOUD | WHATSAPP CONTROL | 10 CUSTOM SKILLS

24/7

AUTONOMOUS RUNTIME TARGET

15m

FOUNDER TIME PER DAY

$0

YEAR 1 GOAL WITH CREDITS

Prepared from the project documentation on March 31, 2026

1. BUSINESS GOAL

What this system is trying to solve

Replace fragmented marketing work with one repeatable operating layer that can create, post, learn, and report.

Core Objective

- Run Black Layers digital marketing from a single AI-driven workflow.
- Support brand visibility, lead generation, and ongoing market research.
- Reduce dependence on manual posting and scattered tools.

Founder Experience

- Use WhatsApp as the control layer.
- Ask naturally for content, research, or client hunting.
- Receive daily reports and only review what truly needs approval.

500
FOLLOWERS TARGET IN MONTH 1

2-3
INBOUND INQUIRIES IN MONTH 1

30+
MONTHLY LEADS TARGET BY MONTH 12

$25
EXPECTED STEADY-STATE VM COST

2. OPERATING MODEL

How the founder and the agent work together

The system acts like an operating teammate: Abdul gives direction through WhatsApp and receives outcomes, reports, and escalations.

What Abdul sends

- “Post something about AdClose.”
- “Find me clients who need apps.”
- “What did you do today?”
- “Improve our LinkedIn strategy.”

What the agent does

- Creates posts and drafts.
- Researches topics across the web.
- Tracks engagement and growth.
- Finds and qualifies potential leads.

What Abdul reviews

- Hot leads that deserve immediate follow-up.
- Drafts that need human judgment.
- Daily and weekly summary reports.
- Saturday YouTube script output.

Time Model

Morning: read overnight summary. Afternoon: approve flagged items. Evening: review report and hot leads. Saturday: record one prepared video. Total operating burden stays around 15 minutes per day plus a short Saturday session.

3. SKILL SYSTEM

The 10-skill architecture behind the agent

Each skill handles a defined slice of the workflow while the master brain coordinates them into one operating system.

Master Brain

Coordinates all tasks, listens on WhatsApp, and manages the daily system.

Brand Identity

Keeps all messaging aligned with Black Layers positioning and proof points.

Content Engine

Writes blogs, scripts, captions, comments, and outreach copy.

Video Creator

Builds Shorts, Reels, and video assets with narration and visuals.

Image Creator

Creates graphics, thumbnails, quote cards, and visual posts.

Twitter Manager

Runs X posting and engagement with the dev and startup audience.

LinkedIn Manager

Handles professional posts, founder positioning, and B2B visibility.

Lead Hunter

Monitors startup and freelance channels for relevant opportunities.

Analytics Reporter

Tracks performance and delivers daily and weekly summaries.

Self Improver

Uses data to change timing, content mix, and strategy every week.

4. DAILY ENGINE

What the automation loop looks like in practice

A structured daily cadence combines content generation, engagement, lead hunting, reporting, and learning.

Daily Timeline

6:00 AM	Trend scan and daily planning	AUTO
7:00 AM	Create tweets, LinkedIn post, and captions	AUTO
12:00 PM	Lead hunt and send lead report	VISIBLE
3:00 PM	Send any approval-needed draft to Abdul	REVIEW

Weekly Rhythm

- Monday: blog post and images
- Wednesday: lead focus and short video output
- Friday: analytics and weekly report
- Sunday: self-review and strategy update

Lead Flow

Potential clients come from Product Hunt, Reddit, X, LinkedIn, and Fiverr. The system scores leads, escalates hot ones immediately, and preserves follow-up context in memory.

Learning Loop

The agent tracks top-performing content, tests new timing and

5. CLOUD FOUNDATION

Verified project state and target runtime architecture

The Google Cloud project exists already. The runtime model is ready conceptually, but infrastructure execution has not started yet.

Target Runtime

- OpenClaw as the orchestration brain
- Headless Chrome for web automation
- FFmpeg, Edge-TTS, ImageMagick, and Python helpers for content generation
- Persistent disk for skills, memory, logs, and generated assets

External Connections

- WhatsApp for founder communication
- X, LinkedIn, Instagram, Reddit, Quora, YouTube for publishing and engagement
- Lead sources like Product Hunt and Fiverr for outreach opportunities

Verified Google Cloud State

Project name	**BlackLayersAI**
Project ID	**`blacklayersai`**
Project number	**`733441966639`**
State	**ACTIVE**
Enabled now	**Storage, Logging, Monitoring, BigQuery services**
Still missing	**Compute Engine API and VM provisioning**

This state was verified from the Google Cloud CLI on March 31, 2026. No VM, disk layout, or OpenClaw runtime has been provisioned yet.

6. ROLLOUT PLAN

How to move from documentation to a working system

A phased rollout keeps the setup controlled and avoids jumping straight from vision into risky full automation.

Phase 1

Prepare the existing project. Confirm billing, enable Compute Engine, and define the production zone and VM size.

Phase 2

Create the VM. Install Ubuntu dependencies, Chrome, Node.js, FFmpeg, ImageMagick, Python tools, OpenClaw, and PM2.

Phase 3

Install skills and data layout. Clone the repo, copy skill files, and prepare the memory and content directories.

Phase 4

Connect channels. Attach WhatsApp, sign into publishing platforms, and begin with monitored autopilot before full trust.

Suggested VM Starting Point

- Machine type: `e2-medium`
- Boot disk: 100GB SSD
- OS: Ubuntu 22.04 LTS
- Zone: `us-central1-a`

Important Rule

Start with infrastructure and preflight checks first. Treat live posting, outreach, and browser automation as later steps after the system is stable and observable.

7. READINESS AND RISK

What is ready now, and what still needs attention

The strategy is clear and the cloud project exists, but production readiness still depends on infrastructure, security, and operating controls.

Already in Place

Google Cloud project exists and is active	DONE
CLI access verified for the owner account	DONE
OpenClaw skill docs and planning docs exist	DONE
Storage, Logging, and Monitoring APIs are enabled	DONE

Still Required

Enable Compute Engine API	PENDING
Create VM, disk, and runtime services	PENDING
Define secrets, backups, and monitoring rules	PENDING
Connect WhatsApp and social platform sessions	PENDING

Main Risks To Manage

- Platform reliability: browser automation can break when site flows change.
- Operational safety: auto-posting needs approval boundaries and rollback habits.
- Security: credentials, sessions, and VM access need a documented secrets strategy.

8. ECONOMICS AND NEXT STEP

Why the model is attractive and what should happen next

This approach is compelling because it lowers monthly cost dramatically, but it still needs a disciplined preflight before becoming a true autopilot system.

Economics

- Year 1 target: near-zero infra cost using Google Cloud free credits.
- Year 2+ target: roughly $25-35/month plus optional AI API usage.
- Compared with a human marketer, the operating cost is dramatically lower.
- The system can report daily, work continuously, and preserve context over time.

Recommended Next Move

- Do a controlled preflight for billing, APIs, VM creation, secrets, and backups.
- Set approval rules for what can auto-post versus what needs Abdul to confirm.
- Launch in monitored mode first, then graduate to deeper automation.
- Treat the current state as “ready for execution planning,” not “ready for live autopilot.”
